EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Douglas H. Goldhush on 03/08/2012.

a. Claim 1 and 13 is to be replaced with the below claim language:

1. (Currently Amended) A method, comprising:

transmitting multicast data packets in at least one first multicast tree from one transmitter through a plurality of multicast controllers to a plurality of recipients, wherein only unidirectional downlink communication exists between the multicast controllers and the recipients;

generating at least one second multicast tree reserved for control messages in an internet protocol network beginning from a network multicast controller and ending to one or more multicast controllers at cell level; and

the cell level multicast controller originates a message to join the second multicast tree, if the join message is received, then transmitting the control messages from the network multicast controller along the at least one second multicast tree

reserved for control messages to the at least one multicast controller at cell level, the control messages comprising information on the multicast transmission of a internet protocol network and a command configured to connect to the at least one first multicast tree of the internet protocol network configured for multicasts.

13.(Currently Amended) An arrangement for implementing multicasting in internet protocol networks, the arrangement comprising:

a plurality of routers configured to transmit different components in the internet protocol networks to each other;

at least one first multicast tree configured to transmit multicast packets through a plurality of multicast controllers to a plurality of recipients, wherein only unidirectional downlink communication exists between the multicast controllers and the recipients;

a plurality of cell-level multicast controllers configured to transmit packets to the plurality of receivers; and

a network multicast controller that is arranged to control the cell-level multicast controllers,

wherein an internet protocol network comprises at least one second multicast tree reserved for control messages and configured to route control messages beginning from the network multicast controller and ending to the plurality of cell-level multicast controllers, wherein the cell level multicast controller originates a message to join the second multicast tree, and if the join message is received, the network multicast

controller is then configured to transmit the control messages along the at least one second multicast tree to the plurality of cell-level multicast controllers, and the control messages comprise information on the multicast transmission of the internet protocol network and a command configured to connect to the at least one first multicast tree of the internet protocol network configured for multicast transmissions.

b. Cancel claim 16.

Reason for Allowance

For claim 1 and similarly 13, the closest prior art Thompson (US 2002/0073086) discloses a multicast tree that transmits a join command to edge devices, where based on this command the edge devices connect to a second multicast tree for multicasts. The second closest prior art Ollikainen et al (US 2002/0035730) discloses setting up multicast for a end device that does not have an uplink to its immediate multicast transmitter. However, the prior art does not by either anticipation or combination disclose the following:

“transmitting multicast data packets in at least one first multicast tree from one transmitter through a plurality of multicast controllers to a plurality of recipients, wherein only unidirectional downlink communication exists between the multicast controllers and the recipients;

generating at least one **second multicast tree reserved for control messages in an internet protocol network beginning from a network multicast controller and ending to one or more multicast controllers at cell level**; and **the cell level multicast controller originates a message to join the second multicast tree, if the join message is received**, then transmitting the control messages from the network multicast controller along the at least one second multicast tree reserved for control messages to the at least one multicast controller at cell level, the control messages comprising information on the multicast transmission of a internet protocol network **and a command configured to connect to the at least one first multicast tree of the internet protocol network configured for multicasts.**”
